Salary and Remote Work Trends Across Job Titles and Company Locations

SQL / MS-SQL Server Project — Vaishnavi Patil

Introduction

This project analyzes workforce salary and remote-work data using SQL / MS-SQL Server.

Objectives

Analyze company size, salaries, salary growth, remote work, locations, job titles and experience levels.

Dataset and Database

Dataset: Salaries.xls. Database: Workforce_Data_Analysis. Main table: Salaries.

Methodology

The dataset is imported into SQL Server and analyzed using filtering, grouping, aggregation, CTEs, subqueries, CASE expressions and window functions.

Tasks

Twenty analytical tasks cover company size, part-time salary, mid-level salary benchmarks, senior-level locations, salary growth, entry-level growth, remote-work updates, 2024 salary updates, salary ranking, employment percentages, remote managers, large companies, high earners, entry-level benchmarks, highest-paying countries, sustained growth, remote-work comparisons, salary increases, role-based access and career guidance.

Key Insights

The analysis supports comparisons of salary by role, experience and location, remote-work patterns, company size and employment type.

Recommendations

Use salary benchmarks for compensation and hiring decisions, remote-work analysis for workforce policy, and job/experience comparisons for career planning.

Limitations

Interpret results using the records actually present in the dataset. Backup the table before UPDATE tasks. Only explicitly specified Task 8 percentages are applied.

Conclusion

SQL provides a structured way to transform workforce records into salary, remote-work and career insights.
